

Restoring Sydney's urban bushland

8 pm, Wednesday 17 May 2017

Charlotte Simpson-Young, a PhD student at UNSW, is studying the structure and function of Sydney's urban bushland to better understand the impact of urbanisation on our native plant communities and which species may be most at risk of local extinction. She will explain her urban revegetation sites and what ecological functions they provide, and how they compare to remnant bushland.
